"GAMES AT THE SPEED OF LIGHT..."

LIGHTFORCE is for **VENGEANCE**.....
LIGHTFORCE is the Punishment Arm of Galactic Fighter Command.
 When a Terran-settled system at the edge of the galaxy is seized by an alien force, revenge comes in the form of a lone **LIGHTFORCE** fighter.
LIGHTFORCE confronts alien in a dazzling battle above the strange landscapes of the Ice Planet the Jungle Planet Alien factories and the impenetrable Asteroid Belt.
LIGHTFORCE — at the speed of Light — from **FTL**.

SHOCKWAY RIDERS are the pick of the street gangs - **ATHLETIC, AGGRESSIVE & ARROGANT** - as they cruise along the triple-speed moving walkways that circle the great **MEGACITY** of the 31st Century.
THE ULTIMATE AIM OF EVERY RIDER is to go "**FULL CIRCLE**" - to do that he must fight off the Black Boys, the Cops and the Vigilantes - as well as negotiating the Speed Traps and Roller Ramps erected by the angry local residents!
SHOCKWAY RIDER is the most original arcade game of the year - **THE ULTIMATE FUTURE SHOCK!**

How to submit articles: Articles which are submitted for publication should not be more than 2000 words long. The articles, and any accompanying programs, should be original. It is breaking the law if copyright in copy programs is of other magazines and submit them here — so please do not be tempted. We cannot guarantee to return your programs — so please do not send your only copy. Accuracy: Popular Computing Weekly cannot accept any responsibility for any errors in programs or published, although we will always try our best to make our programs work.

No Plus 2 till October

THE Spectrum Plus 2 isn't now expected in the shops until mid-October, despite the fact that it was launched at the beginning of this month. At the launch of the machine at the PCW Show, Amstrad said that it was "due in the British High Street later this month," but both WH Smith and Amstrad Distribution say it's not expected in the stores for another three weeks.

The delay is pressed for Amstrad, which doesn't usually announce machines until they're ready to go into the stores, and it's not clear if there's any problem with the machine.

As it is practically identical

to the Spectrum 128 it's unlikely that there could be a design problem, but it may be that Amstrad is trying to make the machine look both old and new.

The company will however be spending £2.4 million on advertising the machine this Christmas, and Barry Young, managing director of Amstrad Distribution, is predicting that it will take 40 per cent of the games machine market over the next few months.

The new Amstrad PC is however ruffling feathers among some dealers. Amstrad will only sell the machines through what it

describes as "approved Amstrad dealers," and Amstrad Distribution has sent out a letter detailing the requirements for this.

"Unless you are able to meet the criteria as specified, then please do not waste our time or yours," it reads warningly.

The major requirements are that shops selling the PCs should have a "Business Computer Centre," with two staff trained in the Amstrad range and facilities for individual hands-on demonstrations. The Centre should also

be separated from home computers and games software. These conditions are likely to cause severe space and staffing problems for small dealers, but will also mean that many major multiples will need to reorganise their stores.

From Amstrad's point of view it could however be useful to have smaller dealers ducking out of the PC range and continuing to stock the PCW, as this will avoid the two machines getting into too close competition with each other.

Low-cost hardcard planned for PC

AMSTRAD is now predicting that first shipments of its PC will arrive at the end of this week. It is, however, unlikely that hard disc versions of the machine will be available for some time yet, and third parties are already getting up to play the game.

Foremost among these is distributor Northernbar, which has been taken on by Amstrad to supply the PC and which hopes to secure a rep-

ply of hardcards this week.

A hardcard is basically a small Winchester hard disc mounted vertically on a card which is plugged into a PC's expansion slot, and has the advantage of being easy to fit and allowing both floppy drives to continue to be used.

Amstrad's hard disc on the other hand fits into the position normally used by one of the floppies.

Northernbar is reluctant to

talk about the cards, but it's believed they'll be available in both 10MB and 20MB versions. According to spokesman, Eddie Moore, the cost will be comparable to Amstrad-supplied hard disc machines and less than an Amstrad upgrade.

Like the Amstrad hard disc units they will take up one of the machine's three available expansion slots, but because of the width of the card they'll also limit one other slot to a half length card. Because the Amstrad already has most of the RAM and I/O you'll need on board, this, however, is unlikely to be a problem.

PCW now stores more

YET another company is to supply a hard disc unit for the Amstrad PCW. The latest upgrade is from ADD Peripherals, and costs £874 for a 10MB drive and £889 for the 20MB. The units are external, and include an extension to the PCW's expansion bus so that all existing add-ons can be used at the same time.

The complete setup consists of a controller module which plugs into the expansion socket of the PCW and a contained drive unit and power supply that sits under the PCW's base.

Details from ADD Peripherals, 023224 49238/9.

Amstrad PC user group

A user group for the Amstrad PC has been formed already. The 1512 Independent User Group intends to publish a regular newsletter, run a helpline, offer software discounts, hold meetings and run a public domain software library. Membership is £20 a year. Further information is available from Paul Mullen on 0752 650606.

A hard card is better...

Sidcar to launch soon?

COMMODORE is thought to be preparing to launch Sidcar, its PC emulator for the Amiga, in the UK shortly. Price isn't yet certain, but according to a source within the company it's to be pitched low to match the price of the Amiga 3, the new entry-level Amiga. Commodore intends to announce at the US Comdex show in November.

Commodore UK general manager Chris Kaley is still adamant that there will be no new Amigas in the UK, either announced or in the shops, before Christmas, and although a spokesman confirmed that there would be an announcement from the company this week, he categorically denied that it would be Amiga-related.

Kaley however doesn't rule out the possibility of new products being shown elsewhere in the world. Commodore UK is currently thought to be working on both the Amiga and the 64 range, with the Ranger, a 68020 machine coming in above the current Amiga and a lower cost development, the Amiga 3, coming in under it.

The 64 range is also thought to be undergoing revision. The recently launched 64C is being viewed by industry sources as a stop-gap machine that will be the subject of development, reducing the chip set to make it cheaper to produce and

easier to upgrade. This of course clashes with the 128, which was originally intended as the upgrade path for the 64, but which is expensive to build and has largely failed to displace the older machine.

Commodore UK denies that it is withdrawing the machine, but of the two models only the 1280, which is too expensive for a mass-market machine, is now readily available in the UK. The company therefore needs to be able to price its 8-bit machines lower if it is to remain in the home market.

Acorn shows up in Manchester

THIS weekend's Electron and BBC Micro User Show will feature Acorn itself, showing its new Master Compact machine. Among the machines expected are a £760 Winchester system, £79 Master console unit and a £16.95 Rom cartridge adaptor from Viglen, while Core Electronics will be showing cheap Master cartridges and an emulator to allow old Rom cartridges to work on the new machines.

Among the other companies present will be Norwich Computers, showing a yellow Rom for Wordwise Plus, and Advanced Computer products with a new disc interface for the Electron.

Software Hotlines

Not wishing to repeat the success of their last major licensing deal (Spasmodic), **Raymond** is pulling all the stops out for *Star Trek* — as the development studios go for infinite (see below). It's big (1000 Atari), complex (255 subplots), and looks lovely on the telly (lots of digitised pictures of crew members, etc).

The plot has the Enterprise investigating the mysterious destruction of Federation starships within an area of space called 'The Guastavina Zone', centred around the planet Ataxia. Lucky stuff if they don't run out of memory, it could well be the game of the year... although exactly which year is still uncertain.

It's official — multi-player sword-slasher arcade games are in, the whole thing started off around a year or so ago in this country with that one-to-four player fantasy adventure from **Atari**. Gauntlet, soon to be emulated in some fashion by **US Gold** (clanster if it's a two player adaptation) — should be hitting the arcades soon. Then came **Saga's** attempt at the multi-player market, *Quater*. Although placed in a space-age setting, this shoot-'em-up was never as graphically impressive as *Gauntlet*.

This was followed by **Super Sprint**. Again from **Atari**, this is 1-3 player racing game, derived from their multi-screeners game *Sprint*. Possibly the best game in the arcades at the moment, **Electric**

Kirk quarantined

Dreams is in negotiations presently for the home computer rights. But who is going to be the first to go for *Starpage* — the latest multi-player from **Bally-Midway**? This is a 1-3 player game in which you each play a gigantic galleon taking apart an American city — complete with National Guard sharpshooters and innocent civilians in stamp. Straight out of King Kong, expect one of the big boys to snap this one up pronto.

Here's a heartening tale for any lone programmer. Dennis Robinson started on a BSc Computing course at Bristol University — but decided that they weren't teaching him the kind of things he wanted to know. After leaving he moped around a bit on his Spectrum, came up with a few ideas on how to implement *Ultarian* on it... then went to visit Hewson.

However, by coincidence, Neil already been thinking along the same lines — so the company took him on, and the rest is history. Everyone that saw the demo at the PCW show couldn't fail to be impressed — it'll be out on 26 October.

John Cook

First launches £50 PC integrated package

PRICE for integrated software packages for the PC are set to tumble shortly, with the launch of **Decision Director**, a £49.95 combination spreadsheet and word processor from **First Software**. As the package will be priced lower than most PC word processors it should provide stiff competition for the reduced price **Frankensoft** (see separate story) despite the fact

that it doesn't include a database.

First will also be importing a new database, **Adis**, to be priced at £86. This again will be under the predicted price for the PC1612 version of **Adis** II.

Details from **First Software**, Unit 200, Horseshoe Road, Horseshoe Park, Pangbourne, Berks RG6 7SW 07357 8244.

Enterprise zone

Apple launches new 16-bit IIGS

APPLE'S follow-up to the Apple II, the IIGS, is to go on sale towards the end of the year at an entry-level price of £995. The machine is compatible with the II series — which it will replace — but uses the 68010 processor, which is the 16-bit version of the 6802 used in the Apple II.

The basic system consists of 256K Ram, monochrome monitor, mouse and external 3½ inch 800K drive unit. The main system unit has composite and RGB outputs, headphone jack, bus input port, disc interface for both 5¼ inch and 3½ inch drives, two serial ports, communications chip and joystick port. It also has eight expansion slots, and sports a synthesiser chip. Ram can be upgraded to 512K and the 128K floppy to 1MB, and resolution is 640 × 300, with seven display modes.

The new Apple

Apple confirms that the IIe and IIc are now dead, and in this country proposes to target the new machine at small businesses and at the II's ex-

isting user base. An upgrade for existing users will be available in the US, but Apple UK is unlikely to bring it into this country.

Horse feathers KBS' nest

KBS Interactive Software considers that its latest idea is a winner. The company claims to have been working on the use of expert and rule-based micro systems for use in everyday applications and, says Cliff Watson-Goodwin, "We decided to apply rule-based theory to what must be every punter's dream — making a profit at the races."

KBS claims a success rate of 80 per cent plus, and is to

launch the system on the open market at the beginning of next year. Punters eager to press money into KBS' hands before then should, however, bear in mind that similar computerised systems were being blamed for last week's spectacular crash on the New York Stock Exchange.

In a separate initiative KBS is also opening a 'software factory' near its Tyne & Wear base. The idea of the factory

is to offer young programmers working space and office facilities for £12.50 a week, and to try to encourage a cross-flow of business between the programmers and KBS. Interested parties should phone 0207 643063.

NLQ extras for Epsoms

THE M&M Technix NLQ Printer Buffer is a buffer and NLQ upgrade for dot matrix printers. The buffer size can be either 8K or 32K, while the NLQ feature, which requires an Epson-compatible printer with quad-density graphics, allows print in four character sizes and a variety of fonts. Three of these are supplied with the buffer, and further versions can be obtained from M&M. The units cost £128 for 8K and £164 for 32K.

Details from M&M Technix, Abington Business Centre, 240-276 Camerton Road, Dorset DT2 8AG.

Cheap dBase out soon for the PC

A £120 version of dBase II should be available for the Amstrad PC later this year. The program is already available in CP/M format for the Amstrad PCW, but like other major software producers publisher Ashton-Tate had until recently set itself against price cuts on its PC software range.

But now, in a spectacular volte face, A-T has bowed to the inevitable and has invited tenders from third party distributors to handle support and marketing for both dBase II and a low-cost version of the Framework integrated package. The latter will be cut down to avoid damaging the company's existing market for the full version, but dBase II, which has to an extent been superseded by dBase III, will be practically a full version.

Mailmerge for Locoscript

CMAS is a mailmerge utility designed to work with Locoscript. It supports right justification, tabs and centred text and allows you to select particular people from your list before doing a mailshot. It costs £25.95.

Details from Process Computing, 2 Ryle Road, London W8 6J1-740 2502.

Real-time clock for the 64

ELECTRONIC and Computer Workshop has produced a battery backed CMOS Ram and real-time clock plugin module for the Commodore 64. The module's timing facilities aren't affected by the 64's internal timings, which are often interrupted, and it includes 50 bytes of CMOS Ram which can be used to store information such as set-up data even when the machine is switched off. The module costs £26.11 in kit form, or £50.45 ready built.

Details from Electronics and Computer Workshop, 171 Broomfield Road, Chelmsford, Essex CM1 1RY 0246 282149.

M&M Technix's new buffer

New printers from Citizen

CITIZEN has launched three new printers — two in its MSP series and one new high quality model, the HCP 48.

The MSP 102 and 152 are functionally identical, but the 102 is 80 column while the 152 is 132. Draft output speed is 160 cps and near letter quality 40 cps. The machines have 68 buffer, full bit-image graphics, proportional spacing and Epson and IBM compatibility built in. They cost £349 and £449 respectively.

The HCP 48 prints at 1200 cps in draft, 132 cps in correspondence and 68 cps in letter quality. It has 128 column width, Cerionics and PS232 interfaces as standard, and optional IBM and Epson emulation. The HCP 48, which costs £935, has a 24K buffer and can take additional plug-in fonts.

Viewdata for free

THE Middlesex Training Centre has set up a free viewdata service whose subject matter ranges from local Hillingdon information, through computer news, to information about the centre itself. The service includes a wide range of machine specific databases and a mailbox facility, and runs 24 hours a day, 365 days a year.

Details from Hillingdon (loc. Harlow) House, Wellington Road, The Trading Estate, Uxbridge, Middlesex. Tel: 0895 55848. Pressed mailbox 0895 31725 or 0895 59843 for viewdata access.

CD survey published

CD-ROM Standards: The Book is the latest phase in the micro industry's plans to develop a standard volume and file structure for CD-ROM drives. The book puts forward the standard proposal developed by the High Sierra (no relation to the firm of the same name) Group, leading participants in which include DMC, Apple and Microsoft. It is described by the publishers, Learned Information and Infotrack, as the "definitive guide to CD-ROM standards," and is being sold for £50.

Details from Learned Information, Woodside, Hinkley Hill, Oxford OX1 5AU. Tel: 0865 732376.

Smart switches for Data

CRAFT Data is now importing a range of switch devices, designed by US company Via West, to allow users to share peripherals. The switches cover IBM, Centronics, RS232 and other common interfaces, and switching between devices can be either manual or through software. They need no external power supply, and start at £30.

Details from Craft Data, 82 Broad Street, Chesham, Bucks HP8 3ED. Tel: 0494 778235.

User group with Flare

FLARE Technology's Ram Music Machine has acquired an official user group just weeks after its launch. Price and benefits of membership had yet to be fixed as *Popstar* went to press, but further information is available from organiser Al Straker, 79 Sandingham Road, London NW2 5TP.

Taspro goes onto Amstrad

TASPRO, Seven Stars' Ramword utility which allows proportional spacing in justified Ramword copy, has now been converted to run with Ramword 454 or 454-D. The pro-

gram includes pause control for daisywheels, allowing printwheels to be changed during printing, and handling of alternate mode characters in Epson F680 proportional mode. It can also justify re-defined characters, and supports a wide range of printers. Price is £7.95.

Details from Seven Stars Publishing, 34 Squirrel Rise, Marlow, Bucks SL7 3PW. Tel: 0494 3445.

ST gains Transputer

KUMA is selling its K-max parallel Risc processing system for the ST for a cool £1,308. The system consists of a dual processor board containing two Kmax Transputers and two blocks of Ram of 256K each. The system has a potential speed of 15 Mips (million instructions per second).

Technical freaks can get details from Kuma, 12 Horse-shoe Park, Pangbourne, Berks RG8 7JW. Tel: 01635 74335.

Correction

In *Popular*, September 11, we inadvertently gave the incorrect number for Memotech Computers, in a reply to a letter.

The correct number is 0863 76691, and Memotech's new address is Unit 24, Station Lane Industrial Estate, Wimbor, Dorset.

Diary Dates

SEPTEMBER

26-28 September
Electronic and BBC Micro User Show

UBS1, Manchester
Details: Software, hardware and peripherals for BBC machines.
Price: £1 adults, £2 children, £1 discount for advance booking.
Organiser: Christian Exhibitors, 061-458 8835.

OCTOBER

3-5 October
The Amstrad Computer Show

Reverend, London
Details: Home and business software and hardware for the Amstrad range.

Price: £3 adults, £2 children, £1 discount for advance booking.
Organiser: Database Exhibitors, 061-458 8835.

4 October
2nd Welsh Dragon Computer Show

Caerdydd-Wales Airport
Details: Software and hardware for the Dragon.
Price: £1 adults, children and OAPs 50p.
Organiser: John Price, 04293 5576.

20-21 October
Hampshire Computer Fair
Liphild, Southampton
Details: Business computers.

Price: Free entry by business organisation.
Organiser: Technical Exhibitors, 0703 31957.

NOVEMBER

2-3 November
Electronic and BBC Micro User Show

New Horizons Hall, Greycoat Street, London SW1
Details: Hardware, software and peripherals for the Electron, BBC micro and Master series.
Price: £3 adults, £2 children, £1 discount for advance booking.
Organiser: Database Exhibitors, 061-458 8835.

5 November
UKMA National Electronics Show

National Motor Cycle Museum, Birmingham
Details: Electronic software and hardware.
Price: Free.
Organiser: UKMA, 01682 3258.

Prices, dates and venues of shows are very, very close to those strongly advised to check with the show organisers before attending. *Popular Computing Weekly* cannot accept responsibility for any alterations to show arrangements made by the organisers.

To dump on K-Graph

We appreciated your publication of a review of our business graphics package K-Graph for the Atari ST series in last week's edition of *Popular Computing Weekly*.

Unfortunately the reviewer seems to have been unable to print a screen dump and claims it cannot be done, this is incorrect. Up to four windows can be displayed on the screen simultaneously, this would be pointless if the display could not be printed. To obtain a screen dump all the user has to do is pick up the "Picture Icon" and drop it on the "Printer Icon", exactly as described on page 55 of the K-Graph manual.

An example of the results obtainable by the above method can be seen in our enclosed software leaflet.

All the printing is done by using icons and drop down menus, we were surprised that this is "too fiddly" for Mr.

Evans, there are certainly several options built in, though none of these could be described as difficult.

Jon Day
Sales Manager
Kuma Software

Xen X2

Looking at the two articles on Xen-Basic (*Popular*, September 4/11), may I make two points?

Firstly, the command `[Pogles]` can be used on CPC 664s and 6128s by changing two numbers in Line 300—the number 131 in the fourth row of Line 350 becomes 100, and 129 on the 6th row becomes 100. These are the four bytes of the addresses where the end and start of Basic are stored.

Secondly, the description of `[Mongrel]` has a mistake—Rom should be 0 to examine the lower Rom.

On a general note, I think it would be better to print the data for machine code programs in hex rather than dec-

Can't Fool an Amsdos

Your reply in *Peak* and *Pole*, September 4 concerning loading .Com files under AMSDOS unfortunately doesn't work. No amount of renaming will fool AMSDOS because it creates headers for each file containing all the information about file name, type, length, etc.

I have had this problem myself as I wanted to use `Cyrex` to disassemble .Com files. The solution is first to create a dummy file under AMSDOS with

```
SAVE "TEST.BIN",A:2000,length
```

where length is the size of the .Com file you wish to transfer. Then boot CP/M and use `GO?` to load the dummy file with

```
GO? TEST.BIN
```

Examine the header with `g100` now if you wish. As

real: 205.55.167 is totally incomprehensible, but CD-DA.00 is instantly recognizable (to Amstrad buffs

interesting point is that if you have renamed the file the header still contains the original name).

Next overlay your .Com file using `DD?` with

```
TEST.COM and test
```

600 being the offset required so as not to overwrite the header. Run `DD?` with `g0` and save the final version of `Test` with

```
SAVE length in pages TEST.BIN
```

The length in pages is the original .Com file length plus 600, the header length, all divided by 256. AMSDOS will now recognise your CP/M .Com file. It sounds a bit involved, but works fine. If anyone knows a better way I would like to know.

Alan And
Birmingham

at least) as the call to print a character.

Dean Flint. *Durham*

Puzzle

Puzzle No 226

There are three boxes on a shelf just down in reach. You cannot look inside, but you can remove the coloured balls contained therein.

On each box is a strip, but unfortunately the labels have got mixed up and are on the wrong boxes. Inside each box are two balls in the correct combination, in, red, red, white, white, red/white.

The object is to determine the minimum number of balls to remove from the boxes in order to discover which balls are in which box.

Solution to Puzzle No 221

Answer

The final arrangement of coins is ...

```
R T R T R T R T
R R T T R T T T
R R H H T T T T
R H H H T T T T
H H H H T T T T
H H T T T T T T
H T T T T T T T
H T T T T T T T
```

Solution

The solution utilizes a two dimensional array (2D) to represent the chess board. Each value in the array is originally set to 1. This represents a coin with heads up/pointing. Using conventional X and Y axes each square is taken in the order described in the puzzle.

Lines 70 to 340 'turn' all coins in line either horizontally, vertically or diagonally. This is

exactly the same as the squares attacked by the queens in chess. The coins are 'turned' by multiplying the value in that unit of the array by minus 1, thus +1 becomes -1, and -1 becomes +1. Line 60 'turns' the coin on which the queen stands only if it is heads up/pointing.

Finally lines 1090 to 1030 print out the final array, plus 1 indicating 'heads', minus 1 indicating 'tails'.

Winner of Puzzle No 221

The winner this week is Mr J. Fother of Macclesfield, Cheshire, who will be receiving £10.

Puzzle

The closing date for Puzzle No 226 is October 12.

```

Eidendown price list

I am writing concerning a serious misprint in the PCW show report in *Popular Computing Weekly*, September 11. The misprint concerns our software titles for the Atari ST, ST Range, Space Station, ST Assistant, *Amulet* and *Mr. Jones*.

The programs were criticised as being a little on the expensive side. I agree. The reporter gave incorrect prices: *Space Station* and *Range* are £24.95 (not £29.95), while the others are only £19.95 each (not £24.95).

Reference is also made to an unknown game with rather colourful graphics, but small sprites. This game, *Amulet*, is part of our super demo disc, which includes this game, a slide show and screen desktops.

What's more, it's absolutely free of charge (leaves the cost of the disc) and can be obtained either by sending a disc to us with an S.A.L., or from most Atari dealers. Readers may like to know that the games can be recognised in the shops by their distinctive triangular packaging.

Patent Software

Beginners be warned!

A warning to beginners like myself: it was not until I saw my letter in *Popular*, 28 August, headed 'Difficult de-juggled' that I realised that my recently bought printer CP-60 Type 1, prints out lowercase g very similar to lowercase q. Thus it was no fault of your typographers that my reference to line 145 was printed to include q65765,q66766. In other words (and trying to type with my fingers crossed), this portion should have read q65765,q66766.

By way of anecdote, here is a little tip for program larks: when you finish typing a stage, use line one. Keenoted to record your last line number. When you recommence, load and list 1 to find your starting place. If you update the number at the end of each period it will keep the line in your pencil!

Joseph G Barry
Northants

A new command

With regard to Simon Goodwin's R88 program - 30 new commands for the Amstrad CPCs, *Popular*, September 4 - he deserves top marks.

However, I found a small mistake with one of the commands. The command *SScreen* should be *SScroll* - this is given in the Help command.

Also here's a little addition to save space and loading time.

Replace line 90 in the main program with:

```
90:SA=0: "000.000".0.4+000.1445
```

Then, to load, just

MEMORY 4096:
LOAD "CDS.BIN",41000:CALL
41000

Market Harborough

Questions...

With reference to the article on pages 12 to 13 of *Popular Computing Weekly* 11-17 September 1988 that explained how to repair the Amstrad DMP-2000's buffer to 8K. The article mentioned that a suitable 8K Ram chip could be obtained from RS (ref 301-870), but did not give an address for this company. I would be grateful if you would publish the address.

One further point, on my printer the three pads marked J3 have a link wire going from the middle pad to the right hand pad on the top of the circuit board (looking at the board in the same orientation as in figure 2 in the article) and not as stated in the article a PCB track on the underside. Hence it is necessary to cut or remove this link wire and then to connect the left hand pad

to the middle pad. This may be of help to those readers with particular interest in this article who may be experiencing some confusion over this point.

A Fisher

Preston, Yorkshire

The Ram chip in question (see letter below) is the 6264, 8K (Radio Shack) can be contacted at Lennex Road, Widdow Industrial Estate, Cosby, Northants NN17 5NS (0535 301361).

And answers...

Having read with interest the article on the expansion of the Amstrad DMP2000 printer buffer, *Popular* September 11, I have the following comments to make. I have been doing this modification to the printer for some time now and I am afraid that Mr Race has a lot of his facts wrong. The most important thing that I think readers should know is that just by taking the case off the printer and removing the chip, will invalidate the Amstrad warranty. However, this is not the most important part of the problem.

Point number one. The 8K Ram chip to use is not a 6264 but a 6266 and it is a 28 pin chip, which can be purchased from any good electronics store for less than £3.

Point number two. There is no need for the PCB to be removed from the casing as the link J3 should have a removable top, which when taken off can be changed to the other side, i.e. like in the drawing but without the need of any tools except a small pair of pliers.

I hope that this will clear up a few of the problems that might occur when people without too much electrical knowledge try to use a soldering iron. I might add that this modification to the DMP2000 is a very simple job for anyone to tackle. It seems to me that it was the intention of Amstrad to put an 8K buffer in, but changed their minds at the last minute.

I hope that this has cleared up one or two points on this matter.

J P Palmer
Warrington
Cheshire

Dave Race replies: Indeed the 6264 CMOS IC by 8-bit Ram chip is the one you want. My own DMP printer's J3 link does not have a removable top, but I can well believe that some models do.

To put it in black and white

May I clarify the situation regarding the "monochrome" option for the Amstrad PC1612. In common with the CPC484, the PC1612 is fundamentally a colour computer, the "monochrome" monitor converting each individual colour to a different shade of grey.

Thus the assertion by John Lottice in *Popular*, September 18, that PC games will not run on a monochrome Amstrad PC is incorrect (I suspect he is confusing our "monochrome" implementation with the IBM/Hercules monochrome standard which you can of course fit with a suitable monitor, in one of our expansion slots).

As suggested in his review on page 15, games software houses are converting their games to use the Amstrad 16 colour standard and mouse. At the PCW show we have already demonstrated *Cyber Chess* and *Alpha Miggins* Doppel, both of which use the Amstrad 16 colour mode and mouse (and are available from Amstrad).

R Perry

Technical Manager
Amstrad Consumer Electronics
John Lottice replies: Mr Perry is quite correct, and my apparent assertion that "if you have a monochrome monitor none of the games will run" is actually a load of old codswallop. The text as published didn't, however, reflect what I originally wrote. My point initially was that you can't buy a bottom of the range, near-Amstrad PC compatible with mono monitor and expect games software to run, because they don't in general have a graphics adapter. The Amstrad, as Mr Perry so lucidly points out, doesn't have this problem.

Micro P. MP165

The best M.C.O. of any printer in the price range! Many people think so. This particular printer has been very popular recently and should sell even more quickly at this price. It's highly featured with 180 cps draft speed and a variable selection M.C.O. mode on 70 cps. Manufacture's figure.

It also features inkless friction and tractor feed, 28 buffer, space compatibility, quiet operation, and full graphics capability. This printer runs off the highest specification available for the price. Look at these unattached, actual size print samples.

Superb near letter quality print and high draft speed make the MP165 an outstanding buy at this price. Italic and good underlining along with many other print modes confirms the FACT.

Atari versus Amstrad

John Lattice talks to Atari president Sam Tramiel about the newest Atari computers

If the recent PCW show proved anything it was that the micro market is developing into two main strands.

Amstrad launched its PC in the week of the show, and the machine, although an excellent implementation of the IBM standard, is in no means new. Like Amstrad's other micros it is essentially a well-associated package of tried and tested products, and technically breaks no new ground.

The other strand is currently represented by Atari, which although clearly out-bid by Amstrad at the show, was outdoing the virtues of high tech and depicting the ideas of packaging to everyone who'd listen.

There's generally at least one Tramiel holding court to the press at each major show, and this time, although Jack was absent, some Sam and Leonard were filling the slot admirably. In the company's home US market Amstrad hasn't

made an impact, and won't do until it launches its PC there next spring, so it's curious that Atari president Sam Tramiel already talks of the British company as a major competitor.

The US is currently pretty well overrun with cheap PC clones, and although 68000-based machines like the ST, Macintosh and Amiga have managed to carve out a niche for themselves, there is no sense of a real mass market mass.

Considering the conditions it would seem logical for companies like Atari to battle down the hardware and wait for the PC storm to blow over.

Sam Tramiel, however, doesn't accept this, seeing the PC standard as something Atari should be in position to compete with. Asked how he'll do this he waves his hand sky towards the corner of the room. "With that," he says.

The 'that' in question was, at the time of the PCW show, a mock-up of a new PC-style package of system unit, de-

"The Atari ST will be available in a new housing, so you'll either get it as a complete package or it is carts"

— Sam Tramiel on the new Atari machines

tailed keyboard and monitor based on the ST. According to Tramiel the machine is already in prototype form, and will be launched directly against Amstrad and the clones.

"It'll mean the ST will be also available

under Amstrad, it will be either the same price or slightly over," the argument being that the ST is vastly superior to the PC technically, and can therefore sustain some price disadvantage.

But if it's to compete with Amstrad on price Atari has a problem. Amstrad now has an entry level, single drive machine with bundled mono monitor for £459, and even if Atari were to produce a bundled version of the 500ST to compete here — which clearly wasn't what Tramiel was talking about — it would have to drop the machine's price by around £100, with similar implications for the rest of the range.

Launch date is also equivocal, as Tramiel would clearly like to get the new version STs out this November, while general manager Max Bambridge guarantees "no more new machines before Halloween" (next year's Halloween Fair, then undercuts himself by saying that

because the micro market changes so fast, that statement only holds good for two weeks.

Bambridge also categorically denies that Atari will be launching a 64550 Amstrad-basher, and changes the subject when it's suggested Atari might currently be split over whether to go for Amstrad or not.

As far as Sam Tramiel is concerned, it's more a case of how 'than whether'.

Clearly he wants the ST to supplant the PC as a world

standard, and clearly he wants to begin to make this happen, but he's still looking at market conditions — British market conditions in particular. The question — which he's not too proud to ask people — is whether the ST can compete on a combination of power and price, or whether it can only face Amstrad by competing on price.

If the answer is price, then the next question Atari must ask itself is whether it can afford it. If it decides it can we might just see some interesting new launches a lot earlier than Halloween.

in a new housing, so you'll get it either as a complete package, or it is carts." The mock-up bore the legend "20805T", but Atari isn't saying what it will eventually be called.

Tramiel claimed to be unsure whether the base machine will have 2M or 4M of Ram as standard, but it seems likely that first models will be 68000-based, with 68000 versions to follow.

Focused on price, Tramiel first says it will be priced "competitively", then elaborates.

"There's no reason for it to be priced

**Have you
entered our
Autumn
Competition?**

We've reached the halfway point in our autumn bonuses now, and here are two more science-fiction movie stiffs for you to identify.

Remember — don't spend anything in yet. There are two more firms to be identified next week, and after that, we'll give the money down, and maybe drop a bid or two.

The prizes

Up for grabs are some pretty classy prizes. Five brand new Spectrum Plus 2 will go to the first five winners, then we've got ten Star Micronic printers to give to the next winners. And last but not least, the next 50 winners will receive a Micronic Magnum joystick. So don't lose this page - with prizes like these on offer, you can't afford not to enter.

Picture 5 (above): Which film featured these vehicles?

Picture 8 (left): Not an old friend perhaps, but which movie in the series does this still come from?

The basic alternative for the ST

A new Basic is something that the ST is in need of. On paper there's nothing actually wrong with *ST Basic*, but a combination of bugs, the random destruction of the contents of string variables (probably being the worst), and the awful editor makes programming a right on impossible chore.

So, if you can't be bothered waiting for Atari to replace it sometime in the distant future and you want to do some programming then an alternative is worth considering.

Fast *ST Basic* is one such alternative, from Computer Concepts, well known for their BBC software. Indeed, there is a certain BBC Basic flavour to some of the commands available. Not only that, but a number of word processing features have been included as well.

If you're going to call a perfect Fast *ST Basic* then to retain credibility it should knock along at decent pace. In fact it does more than that, it positively flies. Before we see the results, what the Basic undertook the PCW benchmarks, beating everything in sight from all right to machines (including the Amstrad PC alone) to 88000 based computers like the GL and Macintosh.

Benchmark No.	Speed (seconds)
1	0.145
2	0.88
3	1.328
4	1.488
5	1.81
6	2.58
7	4.188
8	2.73

Average: 1.801 seconds

The first thing to note about Fast *ST Basic* is that unlike the official language, it is supplied on a 128k cartridge which takes up no user memory. After a couple of clicks on the relevant icons, the two main windows of Fast Basic appear almost instantaneously.

These are the edit and output windows. All program output is shown in the output window, naturally, but using some of the available commands it's quite easy to print

outside it; anywhere on the screen in fact.

The edit window allows the inputting of program lines as well as correcting and editing facilities. Amongst the editing options are the facilities to cut, copy, paste and clear chunks of a program listing. The word processing theme continues with a search and replace feature and the fact that you can have two different programs in memory in segments which are allocated 12k when something is put into them at the same time, although they won't run concurrently.

The other window available is the immediate window which is basically used for testing what a particular command will do without having to run a program.

Students of structured programming will be well pleased, because as well as offering *Fast Proc*... *Endproc*, *Repeat*... *Until*, *If*... *Then*... *Else*, *EndIf*, and *While*... *Hand* constructs, line numbers are completely optional in the program. If used, line numbers are simply utilised as labels and so are not automatically sorted as in other Basics. A program numbered 20, 30, 10, 5 will run in exactly that order, not the usual numerical order.

The ST is renowned for its quality graphics so it's nice to see 64 graphics related commands. It's possible to set the various patterns and colours used by the commands that draw lines, circles, pie charts, arcs, elliptical versions of the preceding commands, boxes, polygons, rectangles with rounded edges, fills and plot points.

A useful feature is the ability to print text, in various styles, at any graphics location on the screen, providing that the location is inside the user defined graphics area (which can be outside the output window). Once there, text can be inserted in any direction, for any distance, one pixel at a time, and between it, it does it very quickly, with just one command. Text can also be justified on a pixel rather than character space basis.

Most impressive of all is the

A famous smile for fast *ST Basic*

fill command, a software filler. Once an area of the screen has been defined, it can be moved around at will, although with nine parameters required it's certainly no doodle.

With the *Palette* command available, any of the ST's 812 possible colours can be displayed, something else that *ST Basic* could not manage to do.

An interesting pseudo variable is *Physbase* which can be read or written and determines which part of memory is used as the screen display. So, various picture screens could be loaded in and then displayed instantly by changing the value of *Physbase* to point to them. *Logbase* is a related pseudo variable which points to where in memory all screen output will end up. So, it's quite feasible to set an entirely new display area, free from the constraints of the output window, the size of which cannot be defined from within a program anyway.

File handling, serial and random access, is covered fairly comprehensively, the commands allowing the creation of directories and files and the reading and writing of characters, or blocks of characters, within them.

Perhaps the most staggering advantage of Fast *ST Basic* over the official language comes using the various facilities offered by IBM. Atari *ST Basic* has such no commands, whereas Fast *ST Basic* is incredibly comprehensive, providing the means to do virtually anything. Mouse control, drop-down menus, dialogue

and alert boxes, windows and the like are all available. However, it has to be said that for the more advanced commands a thorough knowledge of the subject is required before attempting to use them.

And finally, there is an assembler built-in which enables Basic and assembly language commands to be used together, in BBC micro style. Unfortunately there are only a scant 11 pages of the manual devoted to the assembler which can hardly be said to be enough.

Fast *ST Basic* is not perfect, program lines can be larger than the edit window (using the left hand side of the line to switch as window scrolls everything along it means you can't see all of the program line at once). There is no command to change screen mode and the sound commands are few (three) and somewhat crude.

One other problem - the manual is inadequate in places; there again how could it hope to cover everything in detail without being so large as to add pounds to the selling price of the whole package!

But any way you look at the thing, it's a vast improvement on Atari *ST Basic* in virtually all departments, very fast and definitely worth considering.

Exploring the cave of the Word Wizard

Educational software has very seldom been 100% satisfactory. Other it is very good educationally but poorly programmed, lacking motivation and ease of use, or very well programmed but totally useless as far as teaching is concerned.

A new product from Time-worx UK, the distributors of

various business software, for the C128 brings a fresh approach to educational software, with *Cave of the Word Wizard*, a spelling game with a built-in speech facility.

The program comes on a disc where Side A contains the main program, and Side B contains additional word libraries. The game is similar in play to impossible *Mission*

you are in the Wizard's Cave, and you must find four crystals to escape.

There are eight levels in the cave (which are reached via ladders and holes), and of course there are monsters, namely rocks, spiders, potholes which will require a piece

The whole thing is very well presented, and is a lot of fun to play even for a grown-up, with several libraries of words that should take care of the more advanced player. A nice touch is the facility to choose between being a little boy or a little girl.

"The whole thing is very well presented, and is a lot of fun to play even for a grown-up, with several libraries of words to take care of the advanced player"

From the Cave of the Word Wizard

or when bumped into.

As you proceed with your quest, the batteries of your torch weaken, and the wizard appears at regular intervals to ask the spelling of a word. It is fair to say that the speech is excellent, the only snag being a hint of American accent. If you spell the spoken word correctly, you are rewarded with some batteries or potholes, otherwise you lose some life. You also if you run out of light or have encountered too many nasties.

The acid test came when young children played the game. The results speak for themselves: children will play it for hours. I would definitely class this game as one of the best educational programs ever published.

The Rolls-Royce of merger programs

No matter how good the hardware, or the operating system, or the programming language, no manufacturer has yet released the perfect programming system.

Which is good news for teachers who like to write their own utilities. And better news for software companies who like to sell utilities to those of us not up to writing our own.

Companies like Inter, which has recently released *Blinker* for the Commodore 64.

Blinker is a Basic linker, somewhat like the merge utilities often included in programmers' toolkits, or printed in magazines like *Popular*.

However, *Blinker* is to merge utilities what a Rolls-Royce is to a Citroen 2CV.

What *Blinker* does is to allow you to create libraries of off-used routines, and incorporate them into new programs with consummate ease. More to the point, it's a rock-solid piece of software which tells you what's happening as it happens, what's just happened, whether anything went wrong, and what the state of play is after it's done all these things.

Error messages are clear and helpful, and the documentation is excellent with full examples, memory maps and so on.

Suppose you want to write a simple database (or even a complicated one). *Blinker* is down into a number of routines: add a record, find a record, delete a record, sort a file, load a file, save a file, etc.

Now, clever chap that you

are, you already have a sort routine, and save, load and print routines, and all sorts of other useful stuff.

Instead of writing it all over again, you simply load *Blinker*, write the master routine to control all the other bits, then type in: *BLINK*, *"SORT"*, *"SAVE"*, *"LOAD"*, *"PRINT"*, etc.

Now *Blinker* will pull in all these routines from disc, tag them onto the end of your main module, renumber everything, and leave the whole job neat and tidy.

It also tells you how much program memory is being consumed, how much available memory is available, and will indignantly look for routines that would create an "Out of Memory" error, or illegal line numbers.

There are lots of other pos-

sibilities too, but what it boils down to is that *Blinker* makes serious program writing a hell of a lot easier.

And there's the rub, as Shakespeare would put it. Who does that much serious programming in 64 Basic? There's also the question of price. *Blinker* will cost you £29.95, which to my mind is precisely £14.95 too much.

So, wonderful as *Blinker* undoubtedly is, I don't see much of a market for it. Pay really, but then I almost never use the Rolls to drop off the laundry either.

The clone of contention

The new Amstrad machine, says John Lettice, is up and running

Amstrad has traditionally made larger and larger piles of money not by selling the obvious so much as by doing it. Obviously there was big money to be made in the home computer market, so the CPC484 was launched. Obviously serious users wanted a complete system that they could use rather than juggle over, hence the PCW8256 and 8512.

The latest move, the launch of the PC1612 series, is probably the most obvious of the lot. IBM has dominated the business market for the last five years and has sold stacks and stacks of its PCs simply by virtue of the fact that it is IBM. Other business manufacturers have followed the IBM standard, and until recently, when a lot of small companies decided they could put together IBM clones, sell them for half the price of an IBM PC, and still make a profit, the bigger companies were all doing very well for themselves.

Now the obvious bit here is that it doesn't actually cost any more to produce a business machine than it does to

make any other machine, and that if a company were to produce a PC clone in volume it could sell it at a price low enough to make the business manufacturers lose interest in the PC standard fairly rapidly. That's what Amstrad has done with its PC, and the initial intention is to carve out a large slice of the world market. On first impressions the new machines might just be neat enough and cheap enough to do it.

"The monitor is neatly designed and mounted on a tilt and swivel stand on the top plane"

The machine is simple in construction, it's smaller and lighter than the IBM PC, but the need for 5 1/4 inch disc drives and IBM standard expansion slots has kept its desktop footprint up to around 15 x 15 inches.

The entry-level machine has a single drive plus monochrome monitor, and the series goes up to single drive plus 3DM

hard-disk and colour monitor. The review machine's twin floppy drives took up the whole of the front plate of the machine, and being substantial metal-shielded bays extended back across half of the machine's base unit.

I/O ports are on the left hand side and around the back. On the left beside the vertical control (zero to handle racket) is the keyboard plug and mouse port. I take it the latter's placing was dictated by visual board layout, but while I'm happy to report my first left-handed mouse I'm not sure how the majority of users, who are I believe right-handed, will take to it. Parallel and serial ports are at the rear, with video output and power input (like other Amstrad machines the power supply goes through the monitor) just along from them.

On most PC compatibles the expansion slots are accessed by unscrewing the casing, generally a fiddly task on a crowded desk, but the Amstrad PC uses a hatch to the rear of the top of the casing plus one on the side for access to

Hardware Feature

the cards' interfaces. Both these are easily swapped in and out.

The monitor is again neatly designed, and is mounted on a tilt and swivel stand that fits into a well on the top plate. Unlike standard IBM's monochrome and colour versions use the same video output, with the mono simply showing shades of grey instead of colour.

IBMs also have colour limitations on the number of colours that can be displayed at once — which is why PC games generally have odd colour combinations — but the Amstrad can handle 16 in 60 colour mode. It's also compatible with two of the modes available on IBM's EGA (Enhanced Graphics Adapter), which is more than you can say for most software packages...

Screen quality is quite good, although not superb, and this leads on to a major disadvantage. Because the power supply is in the monitor you can't fit third party monitors to the machine without fitting a new power supply or running two monitors. You'd also better be sure of the monitor you want when you buy the machine, because if you upgrade from Amstrad mono to Amstrad colour you'll wind up with a useless mono monitor.

The machine's keyboard is basically IBM format, although there is a separate *Enter* key on the numeric keypad (operation being similar to the one on the PCW), and the *Alt Control*, *Copy/End* and *Print* (print screen) keys have been moved to slightly more sensible locations.

The feel of the keys is fine, although I've seen better on machines four or five times the price of the Amstrad. The keyboard also includes a joystick socket, but this apparently emulates the cursor keys rather than being compatible with

the standard IBM joystick, so games software will need some amendment.

If you look inside the machine you see what Amstrad really does best. The original IBM machines have sprawling circuit boards populated by large quantities of low-tech chips. The Amstrad on the other hand fits its chip set tidied right down, and rather than being associated with a cheaper for small runs, but costs more for volume production) most of the chips are surface mounted.

The board takes up about two-thirds of the machine's base. The 6138 Ram is made up of 256K chips, while the 128K upgrade will consist of 64K chips fitted into sockets alongside. These extend right under drive A, which would have to be removed to gain access to them. What price third upgrades?

The 8088 processor is fairly central, with a socket for the 8087 maths co-processor alongside it, other major points of interest being several custom chips labelled Amstrad. Developing these will have a cost a packet, but when economies of scale take over they'll make Amstrad's production costs difficult to match.

Operation

Amstrad claims that the machine is spectacularly fast, outstripping all but the Pongole, a little-known PC compatible machine. The claims are true, as far as running Basic programs are concerned, but don't really hold water for normal operation. Disk access for a standard Windows document is marginally faster on the Amstrad than the Bondwell PC, but then again as the Amstrad has the superior 6000 chip running at 8MHz, and the Bondwell has an 8088 running at 4/7MHz, it ought to be a lot faster. The

point here is that the basic mechanics of I/O flatten out performance considerably.

Screen handling is also an impediment to the Amstrad's speed. As far as text display is concerned it's faster than the IBM, but seems slower than the Olivetti M24, which also runs at 8MHz. Graphic screens are more significantly slower. The test used here, which I hardly patent, involves FTS Snake Eagle software (see last week's issue for review) and time taken to run out of fuel. With afterburners engaged the Amstrad took just under three minutes, while the Olivetti turned into a brick at just over two.

The Amstrad, however, is probably still faster than the IBM in terms of graphics. The spectacular differences in Ram speeds (over twice the speed of the M24) can incidentally be ascribed in part to Locomotive's Basic 2, which is very fast indeed. It also runs under Gem, and together Gem and Basic 2 took up over 470K of the machine's 512K Ram, but that's another story.

System software

This is probably the most valuable, and unenvied, area of the whole machine. The standard IBM operating system is Microsoft's MSDOS, and this is included. It is, however, also possible to use the machine with a second system, Digital Research's Dos Plus, which is also bundled, and finally it can be set under Gem, DR's windowing front end for the PC. Gem isn't strictly an operating system, but has been pre-installed on a third disc which also includes Dos Plus.

Working out which you'll use is problem enough, but the confusion is heightened by various bits and pieces that

squint out of the discs as you chug along.

Dos Plus allows a measure of multitasking, and the disc includes a couple of test programs, including an alarm and background printing utility, that take advantage of this. These, however, can only be accessed through Dos Plus, not through MS-DOS or Gerni's Considerable DB wrote both Dos Plus and Gerni I'm sure there must be a way to put the two together, but initial phone calls didn't enlighten me.

Dos Plus and Gerni in fact, although workable independently, don't seem to add up to more than the sum of their parts. Even to Dos from Gerni and you can't get back to Gerni Desktop. Instead you've got to put the Gerni Startup disc back into A, type `autoexec` or `gerni` (although the latter appears not to work if you've run a program in the meantime) then reload the Desktop disc. It seems to me that DB ought to be able to make the two systems a lot more integrated than this.

Compatibility

The way to make a machine totally compatible is to make it as slow and horrible as the original IBM. Armed to its credit, however, does this, but the machine is still almost 100 per cent compatible. Under 1-2-3, dBase, dBase Simulator and Open Access all run, and I had no trouble with a fairly wide range of other programs, apart from Sargent & Lundy, which seemed reluctant to return to a test screen after going to a graphics display. The latter also, however, gives trouble on the Olivetti, where it crashes whenever it seems to be doing...

Hardware compatibility is more difficult to judge, but the machine is likely to be able to take most IBM expansion cards, with a few exceptions.

It won't take an EGA because it can't

pitch out its own graphics, and some serial and parallel cards may cause problems depending on which areas of

memory they use. The advice here is to try before you buy.

Verdict

There are a few disadvantages to the Amstrad machines in absolute terms,

but as a total package of software and hardware they're well up in the front runners among PC clones. Take price into account and they have no competition there. Their competitor elsewhere really depends on what you want a machine for.

If you want a fast, non-compromise machine at the cutting edge of technology you'd probably look elsewhere, but the Amstrads make no pretence to being this kind of machine.

What they are is cheap, relatively fast machines that run more different software packages than any other micro. As the reason the software is mainly business, but as the support market goes away it's inevitable that software of all kinds will be launched for the PC.

So the message is, if you want a fast business PC it's a good buy now (although bear in mind you'll have to buy some applications software and a printer) while if you are an enthusiast it may be worth your while waiting until the support starts coming through. Either way, at the price it's hard to go wrong.

Computer cartoons for the younger generation

Asterix is the most successful attempt yet to create a "cartoon-style" computer game. The graphics are faithful to the spirit of the popular Asterix comic books, and the action is a combination of arcade challenge and simple entertainment.

Asterix, hero of the last Gaulish village still resisting the Roman invaders, must search the countryside for the missing pieces of the Magic Cauldron.

Without these, the village wise-man Getafix cannot brew the magic potion which gives Asterix his invincible

strength.

Asterix and his guest companion Obelix move through some nicely coloured landscapes of trees, villages, Roman forts and deep forests in search of the lost pot.

Movement is three-dimensional and is controlled by joystick, and some display your position, supplies, amount of magic potion available and so on.

Obelix needs a constant supply of horns, so Asterix must battle with him and there are always Roman legionsaries must also be fought.

Games take place in a

Camp: Togaean from Asterix

blown-up section of screen in which the opponents slug it out with punches and kicks, again under joystick control, in a sort of mini-Exploding Fist scenario.

The music is nice, the graphics are fun, and the game must be quite difficult (since I couldn't get very far without). However, the scenery takes an annoyingly long time to draw every time Asterix and Obelix wander from one

scene to another and this along with the lack of complex challenges will probably mean that Asterix will appeal more to younger players.

BMX Simulator to go platinum

The budget software market, with some justification, has often been compared to the singles record market - but whether that's true or not, BMX Simu-

lator is one of the first releases from the new budget software house, Code Masters possesses many of the virtues a good 45 should have.

It's bright, loud, catchy and

it's cheap. In short, everything a budget game should be.

Equal to that huge seller, BMX Racers, this one is an overhead view of various

BMX tracks (seven in all) which you race around, challenging either a friend or the computer.

You manoeuvre your bike round the track using joystick or keyboard. The controls are a doddle - left/right, pressing fire to accelerate, trigger off the fire button to brake.

The tracks start off fairly simple with quite a generous time limit, but get much more difficult as time goes on. You soon find yourself having to use the banked corners to get that extra speed.

The actual sound effect produced as you crank the pedals is a bit peculiar: a cross between a steam engine and someone clapping slowly in the middle of the Albert Hall but the finger-clapping music between races makes up for that.

Great fun, especially as a two player game. I'd say it'll go platinum.

The much too silent service

Pleg! Ping! The sonar gave its microscopic warning of the destroyers relentless advance overhead on a mysteriously clear afternoon in 1944.

The chase had lasted three hours, had seen our deck gun blown to pieces, four torpedo tubes exhausted, engines and hull damaged. Speaking of the hull, that cracked ominously as we hovered perilously close to our maximum test depth.

The dull boom of the depth charges exploding reverberated in our ears as the submarine shook from end to

end from the shock waves. With a tortured howl rivets flew from hatchways and plates buckled and collapsed beneath the awful pressure of being 400 feet underwater. Time to surface. Blowing the emergency tanks, we clawed our way upwards.

Unfortunately the cruiser was waiting and no sooner was the conning tower emerged spouting into the sunlight, than it was blown off.

Thankfully this was the USS PCN undergoing its trials and tribulations in Silent

Service, the ST conversion, from Micro Prose, so it lived to fight another day.

Graphically, this version scores over the C64 original, all the screens, bar the maps, being more detailed, some substantially more. The gameplay is exactly the same but this has a couple of extra missions to take your submarine on.

All is not perfect though. For instance, when on the surface it's impossible to quickly scan around, and if you're looking around, once you get below decks again you'll find the periscope has

moved to the direction you last looked in from the tower.

Despite some shortcomings with non-existent sound effects (bombs and damage from depth charges) Silent Service is a pretty good game even if it's not quite QED.

Popular Appeal ★★

Duncan Evans

One of the silent screens from the silent service

Droids and robots, arcade and adventure from Anglosoft for your Commodore

It's always good to see a new games software house emerging. Anglosoft isn't a new name, but previous releases have been in the MSX and C64 universes.

Droids is a nicely produced arcade adventure with elements of Hergeon's *Rescue* and Igra's *Impossible Mission*. The graphics are big and colourful and the programming is pleasantly fast and smooth.

You control a space commando attempting to disable a rogue battleship. The screen shows two levels of

deck, plus your score, lives remaining and energy level. Energy pods allow you to replenish lost power.

Scattered around the decks are escalators to allow you to change level, hatches to the next deck and terminals to log on to.

Good robots have to be zapped or disabled, and once they're all destroyed you can access a terminal, enter the correct code and shut down that deck.

Teleporters enable you to jump from one deck to another, though it can be a shock to find that the guard

robots get more and more vicious on later decks.

Floors of the deck, both side views and top, can be called up from the terminals, and there's a challenging little reaction-test involving moving an indicator through moving barriers in order to shut down each deck.

Good fun though not hugely original - worth checking out

if you want to encourage a worthy new games software house.

An adventurer's guide to the Hitchhiker's Guide to the Galaxy

The omnipotent Tony Bridge brings you the secret of the Babel fish and more...

When I looked some weeks ago at the problem of the intelligence, screaming door in Hitchhiker's Guide to the Galaxy, but there is an earlier puzzle that gets everyone tearing their hair out: the getting of the Babel fish!

If you haven't solved this one yet, then you may not know that you need the fish to be able to understand what all that garbage is coming out the morcom (although you will know, if you have consulted the guide, that the Babel fish will allow you to hear any alien language in perfect English).

As you'll know by examining the dispensing machine, there is a source of Babel fish in the wagon hold (by the way, just getting to see in the hold is quite a trick - when you first find yourself in this predicament, just input any old rubbish and watch the responses very carefully, particularly scanning the runtimes of senses unavailable to you: it's not the only time that this trick works, so keep it in mind for future use).

"Infocom and Douglas Adams are more devout than to allow you a prized object as easily as merely pushing a button! The Babel fish comes out . . . only to disappear from view through a tiny hole in the opposite wall!"

Back to the fish, and you'll naturally press the button on the dispensing machine. But Infocom and Douglas Adams are more devout than to allow you a prized object as easily as merely pushing a button! The fish comes out all right, but sails across the room at knee level to disappear from view through a tiny hole in the opposite wall. Oh dear.

But there is a hook just above the hole, so maybe you could hang something on this hook, thus covering the hole. Ford's towel doesn't, unfortunately, want to stay on the hook, so something else must be tried. At last the much-dreaded

green wall comes in handy!

So now the hole is covered up, my again. The Babel fish isn't going to give up that easily, however - although it slides down the sleeve of the green, it then falls to the floor, to disappear through a previously unseen drain. You'll find that the towel is quite large enough to cover the drain (you're right, the dressing gown isn't).

But, but . . . As the fish lies there, a tiny cleaning robot whizzes across the floor and, pausing only to grab the fish, disappears through a panel in another wall. Is this fish ever going to give up?

Applying what we've learnt so far, we can safely assume that this panel can be covered up too. What else can we use? Have about Ford's sword? He's asleep now, so he won't mind if you prop it against the panel, and this works fine, except that now, wouldn't you just know it, a second robot stops in to graciously catch the fish as it bounces off the sword!

The Hitchhiker's Guide . . .

Something else is called for here - if you read that last description about the second robot, there's a game of an idea there. Now, you did bring the junk mail with you, didn't you? I hope so, because that is what we need now - just place it on top of the sword, press the button one more time, and watch what happens.

At last the Babel fish is yours; but what a marvelous problem, and what a marvelous feeling for the adventurer when finally solved. This kind of thing is what makes Infocom visual head and shoulders above other software houses. Meanwhile, however, don't think that the wagon hold has given up all its secrets . . .

While we're in space, let's take a look at *Attila Planet* and the peculiar problems

that the game from Adventure Soft UK has been posing to players. As you may have gathered from my recent Corners, I find this story quite a refreshing program, and promising for the future of this company.

Although a lot of exploring may be done at the start, the first priority is to get the access card from the galactic travel vault. This is accomplished by talking to it, when the card will be revealed along with the analgesic ampoule and two tickets to Tricho.

You'll know from the clues on the cassette that you must beware of showing weapons to the police or customs. A good way of hiding such things as the laser sword is to use the tin kube. Just drop the object into kube and when needed, get object from kube. Incidentally, the kube will also allow you to carry more objects at one time than would be possible otherwise.

To get through the customs, ensure that all weapons and doubtful objects like the alloy strip etc., are stored in the tin kube. Once you meet the officials (which may take some doing, I can tell you!), you'll need the card at least. Now you'll come across a pair of angry Aradians who aren't too impressed that you seem to have parked your stupid spaceship right in their parking space! Giving the ticket to them will get rid of them and will also yield up a nice object for you!

Let's finish with a bit more Infocom help. *Witchfinger* is described by the authors as being an adventure for beginners, but as you'll imagine, that doesn't mean that it is in any way a walkover! I haven't got space to go into great detail, but a couple of problems might be giving you a headache if you're too young.

First, don't bother trying to get the discoloured in the police station. Although it is the focus for a spell, you won't actually need that spell during the course of the game. Next, don't get caught by the loose pistol, or you'll land up in jail - the way to avoid them is to simply run in the opposite direction.

You will need to get into the jail at a later stage, but this is accomplished by copying the tree stump on Lookout Hill. Once in the jail, you must get the blanket which you must then use to keep the gale captive. Finally, when in the cinema, look under the seat for something spectacular!

Dungeon Adventure on Spectrum. A severe lack of progress. Any help at all would be appreciated. How do I use these getting collars? Are there any other light sources apart from the resplendent burning wood, and where are they - please! Simon Ames, 22 Albert Road, Tonbridge, Kent TN11 2SR.

The Fantastic Four, part one on BBC B. How does the thing pass the fire in the cavern, and how does the torch move the boulder? Paul Tang, 21 Main Street, Bampton, Barton-on-Trent, Staffs DE14 3ET.

Robin of Sherwood on Amstrad CPC 464. I have got one loosestone, but I don't know how to get the others. Gavin Lenton, 10 Earlsdale Road, Cavers, Co. Cavan, Eire.

Harpoonad on Spectrum. How do you get a job? What do you do with the credit card? What do you do with the little bracket? Martin Cheney, 12 Greenock Street, Arndley, Leeds LS12 3JH.

Heroes of Ram on C64. I can't get past the bear. Andrew Lancaster, 16 Anna Close, Christchurch, Dorset BH23 2MY.

Bored of the Rings on Spectrum. How do I get the debugger that is used to kill the sirens? After climbing down the

ripe, how do I get it back? Simon Ames, 22 Albert Road, Tonbridge, Kent TN11 2SR.

Crystal Quest on Spectrum. How do I fix the engine malfunction and move the lift on several decks? What room after getting blowup? Tony Fox, 15 Spenser Street, Swale, Mertonside LD24 4LN (0561-6031882).

Knight Time on MSX. How do I get my photo on to the ID card, having got camera, film, glass, etc? Matthew Palmer, 21 Beaumont Close, Maidenhead, Berkshire SL6 3DH.

The Hobbit on Spectrum. After carrying Bard to the dragon's sleeping place, what should he do to kill the dragon? How does he kill the dragon with

love and arrows? I would be obliged if anyone can come forward with a solution to this problem. G M Pease, c/o John Harris Assoc, PO Box 214, Maccot, Salsburgh of Oman.

The Maggot on Spectrum. How do I get into the tunnel-like hall? J Hissam, 8 Stringlebourne Avenue, Bush Hill Park, Enfield, Middlesex EN1 2DA.

Questprobe: Torch/Thing on Spectrum. I can't get thing out of the target, or get into Doctor Doom's castle. Help! Philip May, 73 Fiddes Road, Llanishan, Cardiff, S Glamorgan, Wales CF4 5LX.

Twins Kingdom Valley on Spectrum. How do I kill the witch in the castle of the desert king? Simon Ames, 22 Albert Road, Tonbridge, Kent TN11 2SR.

Adventure Helpline

Being harassed? If you are stuck in an Adventure with nowhere to turn, do not despair - help is at hand.

Fill in the coupon, explaining your problem.

Adventure _____
Problem _____

Pager

by Alan Griffiths

This program lists the names of all the Romes present in the machine in order of socket number. It also gives the Rom number indicating service and language entry points and allows any Rom to be switched off by poking zero into the relevant paged Rom type table at \$2A1.

Note that pressing Break will turn all the Romes back on again.

Programming: Spectrum 128

Wobbling Jellies

by M D Lancaster

The following program for the 128K Spectrum will produce fast and complex animation routines.

This is done by storing the screen display as frames in the Ram disc and then using Load to replay them in sequence.

If the program is Run it will generate the plots and save them to Ram before giving the option of saving the frames to cassette or microdisk. However, since the function used is a complex one the

demonstration will take two hours to be generated.

This idea of using the Ram disc to store clean frames in can be applied in various way to create fast animation.

The above illustration is an example of the "wobbly jelly". The listing for this program begins on the following page.

```

Programming: QL

Multi Sided Shapes

by Stephen Salmon

This program runs on a non-expanded QL using a monitor, although line 180 can be changed to

Mode 8 to suit a TV.

When the program is first run an opening demonstration screen is drawn showing the three options available. These are displayed in the menu in the bottom right hand corner of the screen.

Multi Sided Shapes is made up of three procedures which can be incorporated into your own programs. These are *Shapes*, *Prisms* and *Plains*.

Shapes will draw polygons, the pattern

of which can be altered by changing the value of *Step* in line 1530. The *Prisms* procedure draws them with both ends open. The patterns can be altered by introducing a *Step* command into line 1770. The pattern produced by the *Plains* procedure can also be altered by changing the *Step* value in line 1990. The positions of the displays can be altered by using the *X-Centre* and *Y-Centre* values.

Programming: C

Minz

The object of Mins is to destroy the targets in nine locations within a building, or elsewhere, by remote

balloons and helicopter. Also to be avoided are the mines which appear at the start of a screen before becoming invisible. Full instructions are given in the manual.

The listing is quite long and will be presented over three weeks, so if you don't want to type it in send C2 to Ken Smith, 70 Waterfield Street, East Ham, London E6 1MB for a copy on request.

Computer Games is a volatile business. You've got to make the right decisions and work with the right people to be a success. At CRL we've been doing that longer than most Companies have been in business. If you've got a program, you'll want the worldwide distribution we take for granted and the Software Development back-up we pride ourselves in. If you're a designer, a programmer or both, get in touch.

Auckland, New Zealand

VDU

by Alastair Scott

This program, for any Amstrad CPC, provides a VDU command like on the BBC micro. The syntax is VDUa,b,c... Up to 64 parameters can be passed.

For example, VDU4,1,15,0,65 sets Mode 1, Res 2 and prints 'A'.

```

Money Maker

by D G Evans

This program for any Spectrum will generate money. £10 notes to be specific. Just type it in, and it can be easily converted to other machines, run the program and you'll see what I mean. A little effort on your part and you could soon be rolling in the brown notes.

```

Status

by Alastair Scott

After typing in and correcting any errors, this program for any Amstrad CPC should be called by entering 02.

Three five digit numbers are now produced. They are as follows:

1. Length of the Basic program in memory.
2. Length of the variable area.
3. Free memory.

With Menn Garrock

The Amibios hex

Arthur Scott, of Gangesmouth, in Salfordshire, writes:

Q I would be grateful if you could help me with the AMIBIOS disc format.

On examining the directory entry with a disc sector editor, I get a display such as:

```
00 40 40 50 40 40 40 50
40 40 41 50 00 50 00 4A
00 00 00 00 00 00 00 00
00 00 00 00 00 00 00 00
```

I realise that the high-lighted hex digits refer to the track sector that the file (in this case *Envelope.Baz*) is stored at. How can you convert these digits into track and sector numbers?

A CP/M does for this is what it is not set out in the way you might think. The file is split into portions that will fit into the available places on the disc. The directory tells the operating system where the various pieces are. The directory entry is read as follows.

Byte	Contents	Meaning
0	00	Set to 0 if file is valid, 05 if erased
1	E	
2	N	
3	V	Eight
4	E	byte
5	L	Filename
6	0	
7	P	
8	E	
9	0	Three byte file
10	A

23 83 set
24 84 to
25 8C zero
26 00 if
27 00 they
28 00 are
29 00 unused
30 00
31 00

These 32 bytes tell the operating system all of the information it needs to know about the file. The filename and extension are obvious. Files are stored on disc as records of 128 bytes, each allocation unit represents 8 records, and there is space in one directory entry for 16 allocation units, hence 16*8=128=16384 bytes.

The extent entry is used when the file exceeds 195. If this happens, another extent is opened up creating a new directory entry with the same filename and type but with the extent number set to one (or more if the file is really big, calling for more directory entries).

The allocation units are stored in the directory entry from byte 16 to 31 (16 entries as above) and each refers to a block of eight sectors each sector being 128 bytes long. The blocks are numbered sequentially from track 0 sector 0 through the last track and sector (depending on the density).

So to find where a file is stored on disc, look at the allocation units, and then read the right consecutive sectors that each one points to. In your example, the first block is stored in block 36 (38 decimal) or sector 304 (38*8); just divide by the number of sectors per track to get the track number, the remainder is the sector on this track where the file starts. At the end of this block, use the next allocation number to work out the position of the next block.

When you get to the last block, it may not be full, the remainder of the 'number of records' entry divided by 8 will tell you how many records are used.

The numbers s1 and s2 are

used by the system for something but I don't know what, the number of records in the extent is exactly that on single density system (such as the 8128) but is a little more convoluted on double density systems.

Go to Print

J.P. Robinson, Jnr, of Llandek, in Chelms, writes:

Q Please could you tell me what is happening in this short program on the Commodore 64?

```
10 PRINT "TIME"
20 GOTO 10
```

A The Commodore 64 has a built-in clock that starts counting from zero when the machine is turned on. This 'Jiffy clock', as it is known, counts up at 60 times a second even on British machines where the mains frequency is 50Hz and is held in three bytes of

memory, 160, 161, 162, where 162 changes the fastest. $\text{Poke } \$3308 \text{ Peek } (160+256 \text{ Peek } (161+256 \text{ Peek } (162)))$ is the same as *Print D*. The Commodore 64 only recognises the first two characters of any variable name as *Print Time* or *Print Date* are the same as *Print R*, the *Alt* or *On* being irrelevant to the machine.

The internal clock is fairly accurate but is somewhat dependent on whether any input/output operations are going on. Both the tape and disc will stop the clock when they are being used leading to inaccuracies.

T is also what is known as a system variable, ie, it is reserved for system use and updated by the system. Other system variables are *T0*, which can be used to set the jiffy clock to read the time of day.

$\text{POKE } \$08007 \text{ sets the clock to } 0.30 \text{ and } 31 \text{ seconds reading}$

$\text{R} = (1637660 / (118*60*60 + (30*60 + 31) * 60 \text{ jiffy}))$

In the lap of the Gods

David Wallin has news of multi-user game Gods, with a special offer for Popular readers

A while back we looked at a couple of 88 multi-user games, including *Gods*. This week we have a special *Gods* offer for readers of this column, so it's time to look at the game in more detail. There is a personal bias in this, I must admit: *Gods* is my favourite multi-player adventure, despite its join-on fee of £22.

Accessing Gods

Gods can be accessed by any 386/387 or 1286/75 terminal, although I find that 1286/75 works a lot better than 386/387. The number is 01-994-8178 and the protocol 8-bits, no parity and one stop bit (standard 88 protocol).

Free demo mode

To see if you like *Gods* (and you probably will), you can log on as a guest. From the first menu you go to the Play option and enter guest when asked to, and then follow any on-screen instructions.

Most of the other people I have met on *Gods* are friendly and generally pleasant. There is, though, one thing that can turn even the most friendly people to murder, that is an annoying guest.

Guests have a habit of trying to kill other people, so there are plenty of weapons about for the violent people out there to find and kill with, but most other players are peaceful and don't kill unless forced to.

Other players are also helpful to the beginner. When I first started, many others offered to give me guided tours of the area, totally free, to help me. They also offered tips when you are stuck which is useful. It was the other players who taught me about 'valuing' items (see below). Offering items to the *Gods* (see below), performing the 'trick' in *Bob's* temple and other things that had at first baffled me.

Treasure

When you find treasure, you can value it so find what it's worth. When you type 'Value Items', a little character appears, looks at it and tells you its worth in both magic points and gold.

Treasure can be offered to a *God* in his temple. Having asked the guard to take you there, you can type *Offer (item)* to

give the item to the *God*. What happens next depends on the value of the item. If when valuing it you were told that the *Gods* would give you ten for it then the *Gods* will be done with you. If, however, the item is valued above ten, you will be given its value in magic points (called 'magical reserves').

The more items you offer, the better your rank will be. You start as Scout, proceed to *Salt-Of-The-Earth*, then to *Second Class Citizen*, eventually, though Monk and Priest, to finally become a *God*. There are many ranks, and the above are just examples. At the time of writing I am a *Second Class Citizen*, under the persona of *Communicator*.

The 'visual' mentioned above is a method of getting a lot of points, even though you may not have much treasure yourself. To find out more you'll have to play *Gods*.

All good adventures have a maze, and *Gods* is no exception. In *Gods* the maze is the *Kashub*, and it's easy as anything to get lost in it. If you do get lost in the *Kashub*, then keep typing *Out*. Also there is a forest, where you can get lost, but it is quite a bit easier to find your way out of the forest than the *Kashub*.

At present, there are only two spells available: *Whore* and *Summon*. They do exactly what you would expect. *Whore* tells you where an object/person is. *Summon* will bring a person to you. More spells are on their way. Other commands include *Fight*, *Use*, *Ask*, *Get*, *Value*, *Offer*, *Miss*, *Bag*, *Chr*, *Sex*, *Scout*, *Help*, *Abuse*, *Ring*, *Self*, *Guard*, *Get* and many, many, more. The command *Who* will tell you who is currently playing the game.

The Bulletin Board

Running alongside *Gods* is a multi-user Bulletin Board. At present this is a very crude messaging system, where you can leave other players messages, but *Gods* is now running on a new computer and an upgraded 88 is promised.

Gods - the background

Gods is run by three people, Tiger, Major Multination (The Major) and Lucy. They form LOTG (Lap Of The Gods), Tiger, who wrote the software, built the hardware, etc, does most of the running.

Until recently, *Gods* was running on a

68000 Xerox machine, now it has been upgraded to Ultrix, on a 'home-made' computer, consisting of bought-in boards. The *Gods* software (and hardware) is available for sale to budding MUD wranglers, but don't expect it to come cheap! Also LOTG will write custom games to your own requirements and sell a multi-user Bulletin Board system.

The changes in *Gods* are likely to change soon and an hourly playing charge (as implemented when the game is finished), so you'd better join soon and make the most of the 'free' access time available.

Joining Gods

To register you send your £22 to LOTG with some information about your computer and modem. What you must do to register can be found out by Typing *What* at the first menu.

Special Offer

As a reader of *Popular Computing Weekly's* Communications feature, you are entitled to a discount of 18 when joining *Gods*. The cost for a *Popular* reader to join *Gods* is only £18.98 (including Vat).

You have three months to apply to join *Gods* at this special discount price. After that, you will be required to pay the full price.

To be entitled to this offer, you must quote the following as application:

- 1) My Telecom Gold mailbox number (printed regularly on this page)
- 2) The reference *dis/PCW/591*
- 3) The volume and issue numbers of this copy of the magazine.

You must include with your £17, your name, address, signature, date and make/model of computer and modem. You then should leave a message on the BBS, to Tiger, with your name, address and cheque number (if applicable). You will be notified through the board of your account number and password as soon as your registration fee is received.

The address to send off to for a discounted membership to *Gods* is: Discount Offer, Department PCW, Lap Of The Gods Ltd, 188 Portobello Road, London W11 2BB.

WITH EVERY
SPECTRUM
REPAIR

**The established
company with a proven reputation**

Over the years we have built up an enviable reputation in the UK for computer repairs, which is second to none. This is based on many years experience in repairing Spectrum, Commodore, BBC and other leading makes – and we were the first AMSTRAD repair centre anywhere. This is why we have customers all over the world.

Repairs also undertaken for all the following computers:
**SPECTRUM,
COMMODORE, ATARI,
BBC, IBM**

We are the best, forget the rest, look what we offer:

- No high fixed price – you only pay what the repair actually costs.
- Write-U-Wait Service – spare parts for all leading computers – available over the counter.
- State of the art test equipment to provide comprehensive test report and locate faults.
- Repairs to all leading makes of computer.
- Amstrad specialist.
- Spectrum rubber keyboards repaired for only £9.95.
- Commodore 64's, Vic 20's, Atari, Commodore 16's and Plus 4's repaired.
- Discounts for colleges, schools etc.
- Every computer repaired by us is completely overhauled and tested before return.
- All computers returned cartage paid and covered by insurance.
- Three months guarantee included.
- Free Software worth £35 with every Spectrum repair.

**DON'T DELAY –
ACT TODAY
It's as easy as
ABC!**

A Simply send your computer securely packed, together with a cheque or postal order for the maximum fee to the address below. Your computer will be repaired and returned to you within 24 hours together with the balance of the fee and your FREE £35 worth of software.

B Or if you prefer a written quotation just send £2.50 to cover post & packing.

C Alternatively just quote your Access or Visa card number.

You have to hand it to the guys at Automata — they have their reasons.

I will miss Christian Per-
folds displaying his manhood
in that baggy pink jogging suit
every Monday — think dis-
guised as the Firmus.

But Automata's creative
tool, the man with his feet
firmly on the artistic and ide-
ological right was always Mr
Croscher.

A man of many opinions,
whose documented thoughts
start at 'semi-revolutionary' move
towards 'well observed' and,
more often than not, don't stop 'til they get to

'cross' — love him or hate him,
the guy has imagination. And
as far as computer software
goes, that imagination
reached its price with *Deus*
ex Machina.

More like a concept album
than a compilation, *Deus* is a
collection of early original, but
simple arcade games linked
together by their shared fu-
turistic setting. This alone
would be of interest, but the
action proceeds along with a
synchronised soundtrack of
words (credits include Jos
Perfolds and Frankie Howard)
and music (Croscher).

The result had our office full
of amazed people at one time
— but commercially, it was a
 flop.

Who knows why, but it's
out now on Amstrad CPC and
MSX formats, marketed by
CB's Nu Wave label. At this
price a bargain, go out and
grab yourself a piece of com-
puting history.

Program Walkabout Type
Arcade **Micro Commodore**
64 Price £1.99 **Supplier**
Fantasy, 64-67 New Oxford
Street, London WC1 1PS

Program Dante's Inferno
Type **Arcade/Adventure**
Micro Commodore 64 Price
£9.95 **Supplier** Beyond,
64-67 New Oxford Street,
London WC1

I had realised that medieval
scholars used PCW
8051s. But here we are,
at the beginning of an epic
and terrifying journey through
the nine circles of Hell, and
where do we start? Limbo.

Well, obviously Dante

know a thing or two, and his
classic work *Inferno* has now
received the ultimate accolade

the 20th century can give a
literary masterpiece — along
with such exalted company
as *Julien Maie* and the *Poem*
Prophet for instance — in that
it has become the subject of a
computer game.

Programmed by Denton
Designs (now minus founder
members Cain and Everett),
Inferno has you controlling
'pilgrim' (dressed, as all good
pilgrims are, in raggedy cat
boots) through the nine cir-
cles of Hell to reach Rurgatory
on the other side — which is
where some would say ter-
rifying have been for quite
some time.

The game is really a series
of mazes and puzzles, each
more inhabited by different
creatures and hazards, with
problems to solve at almost
every step.

The graphics are well de-
signed and the renaissance
type sound track is refresh-
ingly different — however,
the undead soul that shouted,
"It's like Satan Walk with
knobs on," from the back of
the office, had a point.

No, well presented and at-
mospheric though this partic-
ular arcade adventure is, it is
not the program to pull Be-
yond-out of the doldrums. But
just wait 'til you see *Inferno*
and *Satan Walk*.

The selling game

What's the difference between a budget game and a full price game? Okay, I'll run that one past you again - what's the difference between a budget game and a full price game, apart from seven or eight pence?

I see this is confusing you; let's try it another way. Was the last full price game you bought five times better than the last budget game you bought? That's one way of looking at it, yet my pet marketing expert tells me the real difference between full price and budget is actually where the product is sold.

When something is cheap as that may well have several grains of truth in it, maybe it's time to examine what's going on.

When the games market started, no-one had much idea about anything and the concept of 'price points' for computer software was still a twinkle in the eyes of as yet disappointed marketing managers.

Experienced business people had yet to take home computers seriously, and the wacky, entrepreneurial/pragmatic types just cracked the stuff out for what they thought would sell. Looking at some 3 1/2 year old *Repubes*, that option seemed to vary from £4 to £10.

However, things started to change when glossy ads and full colour cassette plays were invented - games were suddenly a youth culture in-

dustry. Enter the professionals.

Professionals know that for each kind of product there is a price which the consumer likes. Not too expensive - as you need to maximize your profit without losing too many sales. But there again, not too cheap, or the consumer will believe the product to be worthless. This is known as a price point.

For software, this appeared to be around £9 for Spectrum games and £10 for Commodore 64/Amstrad CPC (after all, they paid more for their machines, didn't they?).

As the industry boomed, everyone who programmed for the right machines prospered and was happy. Then in 1984 came budget software, pioneered by Mastertronic.

The professionals laughed. In 1986, one in five games sold is a Mastertronic game, four out of 10 games sold is a budget title and this time next year it'll be at least six out of 10. So what's gone wrong with the status quo?

What Mastertronic realized first - and others are realising now - is that what was considered the industry price point is just too high. The punters (that's you and me) are reluctant to pay out large sums of money for a product of intermediate quality.

High prices do not guarantee high quality (eg. *The Great Secret Race*), so why bother? At least it's a £1.99 game is a dud, you haven't blown a month's pocket money.

Now that budget software has developed so that it consistently outplays with 'full price' in terms of quality, there are even more problems.

An 'industry figure' I was talking to recently was irate. "They seem to be selling a full price product at budget prices." It would put it the other way around. As the quality of budget software improves, it is harder for other companies to justify the 'traditional' price tag at a lower.

Computers are no longer 'whooosh goes the rocket' gadgets - they are simply everyday consumer items, and twice the price of an LP is too much for a single computer game, unless the quality is considerably above that of budget level - and that is where the new adventures and complex strategy games may be an exception here.

"But if we sold our products cheaper, we would go out of business," I hear the cry.

Well, I don't see Mastertronic rapidly going down the tubes. The fact is that lower prices would mean increased sales, less inventory and more interest in the hobby.

There will always be the *Johns of the world* - well worth the money - but as for as the run-of-the-mill releases are concerned, the average price should be lower. How about it, then? Never mind the profit margin, just feel that turnout.

John Cook

NEXT WEEK

Special Supplement Micros and Music

The music supplement is packed with reviews of the latest products - the Spectrum Micro synthesizer sampler/drum machine from Ram Electronics, Chinest's sound sampler, Kawai's K-Musical mini editor, and the Amstrad Advanced Music System. Plus news from the Games of all the forthcoming Commodore and Atari music packages.

Hardware

The reviews of Com's PLUS2 printer/plotter and the Pantek-A 2 system, which had to be omitted from this issue due to lack of space, will be appearing in the October 2 issue. The Com's PLUS2 is both Commodore and PC compatible, while the plotter can be used with a wide range of micros.

Star Glider

At long last, Reinbert's *Star Glider* is finished and ready for release. We bring you a full review.

Competition

The last science fiction movie able for you to identify in our great autumn glossaries.

where do we start? LOOSE.
Well, obviously Davey

knows a thing or two, and his classic work follows has now received the ultimate accolade

of mass and passion, each mass inhabited by different creatures and hazards, with problems to solve at almost every step.

The graphics are well designed and the soundtrack type sound track is refreshingly different - however, the sound itself that shivers. "It's like *Star Wars* with knobs on," from the back of the office, had a point.

No, well presented and atmospheric though this particular arcade adventure is, it is not the program to pull Davey out of the doldrums. But just wait 'til you see *Infoband* and *Star Trek*.

AND THEY CALL THEMSELVES
ADULTS!!!

The times they've left you at home because 'you're not grown up' or 'not old enough to come to the pub' and look what they get up to when they get there! Here's your chance to find out what it's really like in those smoke filled haunts of adulthood. The opportunity to see how good you are at these ADULT?? games.

Why let the mums and dads have all the fun. Pub Games can be a laugh for everyone.

PUB GAMES

a compilation of
BAR BILLIARDS · DOMINGUES
DARTS · TABLE FOOTBALL
POKER & PONTOON
BAR SKITTLES
